

Yearly 170 Gt of biomass is produced by photosynthesis worldwide. Biomass means mainly fat and oil (predominantly triglycerides), carbohydrates (sugar, starch, cellulose, chitin) and lignin. Today only 3 % of the biomass is used as food, fuel or as construction material, e.g. for furniture, etc.

In particular because of the shortage of oil and gas and the problems caused by CO₂ it seems obvious to use these natural resources as raw material in chemical industry or as energy source.

So for example in chemical industry fat and oil are converted to fatty acids by hydrolysis or fatty acid esters (biodiesel), e.g. FAME manufactured by transesterification. Fatty alcohols can be produced by hydrogenation of fatty acids. For the development of the most economical production process, a reliable knowledge of the thermophysical pure component and mixture properties of the compounds involved is required. These are the different glycerides (tri-, di-, mono glycerides), glycerol, fatty acids, fatty acid alkyl esters, fatty alcohols, the different alcohols used for the transesterification reaction (methanol, ethanol, propanol, butanol, ..).

A great part of the required data are stored in the Dortmund Data Bank (DDB). A detailed description of the Biodiesel Package can be downloaded from www.ddbst.com – Products – Special Applications – Biodiesel Related Data). Besides for biodiesel production and processing, these data are of great value also for other applications like e.g. natural oil extraction and purification.

The amount of biodiesel related data stored in the DDB are given in the table.

Data bank	Sets	Points
Vapor-liquid equilibria	3,900	39,000
Azeotropic data	3,300	3,300
Gas solubilities	670	2,500
Liquid-liquid equilibria	2,400	21,400
Solid-liquid equilibria	3,800	30,600
Activity coefficients at infinite dilution	3,600	3,600
Excess enthalpies	910	14,800
Excess heat capacities	110	1,200
Mixture densities	2,600	34,100
Mixture viscosities	2,400	28,300
Electrical conductivities	180	1,600
Octanol-Water partition coefficients	110	110
Salt solubilities	250	1,600
Pure component properties	14,900	64,900
Different thermodynamic properties	5,500	51,300
...		
Total	45,000	300,500

For the efficient use of these data we would recommend the software package DDBSP. The software package allows retrieving the data using several search options (components, systems, literature), has graphical data representations, has copy and print capabilities, and allows data export to PPDx and Aspen INP files. Furthermore with the help of the software package the user can define new components or store own experimental data. At the same time with the software package the required basic data for the compound used, such as name, formula, CAS registry number, Antoine constants, critical data, acentric factor, density, van der Waals properties, melting point and heat of fusion, dipole moment etc. are delivered.

Changes and errors are possible regarding all information and prices.
